## **CERTIFICATE**

This is to certify that this project entitled “**Medi-Track**” has been and submitted by **MUKESH KALO**, M.C.A 2023-2025, **Rourkela Institute of Management Studies, Rourkela**, has been examined by us. He is found fit and approved for the award of “**Master in Computer Application**” Degree. To the best my knowledge this work has not been submitted for the award of any other degree.

I wish all success in his life.

**DEAN ACADEMIC RIMS, ROURKELA**

Prof. Bibhudendu Panda  
Head of The Department, MCA  
Rourkela Institute of Management Studies, Rourkela

## **CERTIFICATE**

This is to certify that **MUKESH KALO** student of **M.C.A, Rourkela Institute of Management Studies, Rourkela, Odisha** of Session 2023-2025 has completed the project successfully.

I wish all success in his life.

**(Prof. Bibhudendu Panda)**

## **DECLARATION**

I, **MUKESH KALO**, hereby declare that the project report Entitled “**Medi-Track**” is of my work. The above work I submitted to “**Biju Patnaik University of Technology, Rourkela**” for the award of “**Master in Computer Applications**” Degree.

To the best of my knowledge, this work has not been submitted or published anywhere for the award of any degree.

**MUKESH KALO**

## ACKNOWLEDGEMENT

I am deeply indebted to **Rourkela Institute of Management Studies, Chhend, Rourkela**, for providing me an opportunity to undertake a project work entitled “**Medi-Track**”.

I am grateful to my project guide **Prof. Bibhudendu Panda** without his guidance it would not have been possible on my part to complete the project.

I acknowledge the help and co-operation received from all my team members in making this project.

I consider myself fortunate that I have successfully completed this project; I acknowledge my sincere gratitude to all those works and ideas that had helped me in writing this project.

***MUKESH KALO***

## **Abstract**

The Medi-Track project is a digital healthcare platform designed to enhance the efficiency and accessibility of medical services by providing an intuitive doctor appointment booking system, specialization-based matching support. The system integrates key functionalities such as electronic medical records (EMR) management, automated scheduling and real-time notifications to improve patient-doctor interactions. Advanced security measures ensure compliance with healthcare regulations like HIPAA and GDPR, safeguarding sensitive medical data. By incorporating the system enables remote consultations, reducing wait times and improving healthcare access, especially in remote areas. The Medi-Track project aims to modernize healthcare delivery through seamless digital solutions, making medical services more efficient, secure, and patient-centric.

# CHAPTER ONE

## **INTRODUCTION**

### Background

Introducing Medi-Track projects, accessibility and efficiency in the rapidly growing world of medicine are essential to the provision of high-quality medical services. Project Medi-Track is an innovative platform that streamlines the healthcare experience with seamless physician appointments, comprehensive physician specialist lists, and improved patient physician interactions. Our platform has a wide range of specialists, including general physicians, cardiologists, dermatologists, and neurologists. Whether it's personal visits or virtual advice, Project Medi-Track has set out to provide modern, efficient, and patient-friendly health solutions.

## Purpose

### **The key goals of this initiative are as follows:**

1. Enable patients to book appointments with doctors effortlessly, reducing wait times and improving healthcare access.
2. Provide a comprehensive list of doctors categorized by specialization (e.g., cardiologists, neurologists, dermatologists) to help patients find the right expert
3. Facilitate virtual consultations, allowing patients to connect with doctors remotely for quick and convenient medical advice.
4. Offer real-time appointment scheduling and availability tracking for both patients and doctors.
5. Enhance interaction through chat, video consultations, and digital prescriptions for better follow-ups.
6. Implement robust security measures to protect patient information and ensure compliance with healthcare regulations.

## Motivation

The growing demand for reachable and green health offerings underscores the want for technical operation answers that simplify patient care. Many people with long wait instances, finding the right expert is hard, and access to medical consultations, in particular far off locations, is constrained. undertaking Medi-Tech is inspired by using its vision to close these gaps via digital transformation in healthcare. by way of using wise scheduling, telehealth, our goal is to create a continuing, clean-to-use platform that combines patients with the right physicians quickly and efficiently. We need to reinforce each patient and fitness provider carriers by decreasing control pressure, improving appointment control, and making sure safe get admission to scientific files. project Medi-Tech is not just about the convenience of making a fitness environment this is reachable, reliable and available to everybody in the future.

## CHAPTER TWO

### **LITERATURE REVIEW**

#### Challenges

Developing a Medi-track assignment that consists of physician appointments and specialization control comes with several demanding situations. one of the number one hurdles is ensuring seamless integration between numerous healthcare carriers, digital clinical records (EMR) structures, and affected person databases even as keeping compliance with guidelines like HIPAA or GDPR. consumer experience is also important—both doctors and sufferers want an intuitive interface for scheduling, managing, and tracking appointments without technical problems.

moreover, enforcing a sturdy specialization-matching algorithm is critical to make certain sufferers are directed to the proper experts primarily based on their signs and symptoms or scientific history. protection and data privateness are predominant worries, as dealing with touchy health information requires robust encryption, authentication, and get admission to manipulate measures. furthermore, real-time availability updates, telemedicine assist, and coping with cancellations or rescheduling efficaciously add complexity to the development manner. Overcoming those challenges requires a combination of superior technology, regulatory know-how, and person-centric design.

## CHAPTER THREE

### **SYSTEM REQUIREMENTS**

#### Hardware Requirements

- Display: 1920x1080 resolution Monitor.
- Processor: Intel Core i5 or higher.
- Network: Internet connectivity or Wi-Fi.
- Storage: At least 256GB SSD.
- RAM: 8GB or higher.

#### Software Requirements

- Visual Studio Code.
- Git
- My SQL
- XAMPP

# CHAPTER FOUR

## **TOOLS AND TECHNOLOGIES**

Graphical User Interface will be the preferred front-end interface to information display, since easy to use even for inexperienced users, it is attractive, provide shortcuts, and allows room for multitasking.

### HTML

Hyper Text Mark-up Language is used for developing front-end Graphical user interface. It is standard language used for web pages.

### CSS

Cascading style sheets are a style sheet language used to show a document or content written in mark-up language.

### SPRING BOOT

Spring Boot is a Java framework that makes it easier to create and run Java applications. It simplifies the configuration and setup process, allowing developers to focus more on writing code for their applications.

### MYSQL

For database MYSQL is used. This technology will ensure that the software is scalable, reliable, and secure.

### JAVA

Java is a class-based, object-oriented programming language that is designed to have as few implementation dependencies as possible. It is intended to let application developers Write Once and Run Anywhere (WORA), meaning that compiled Java code can run on all platforms that support Java without the need for recompilation.

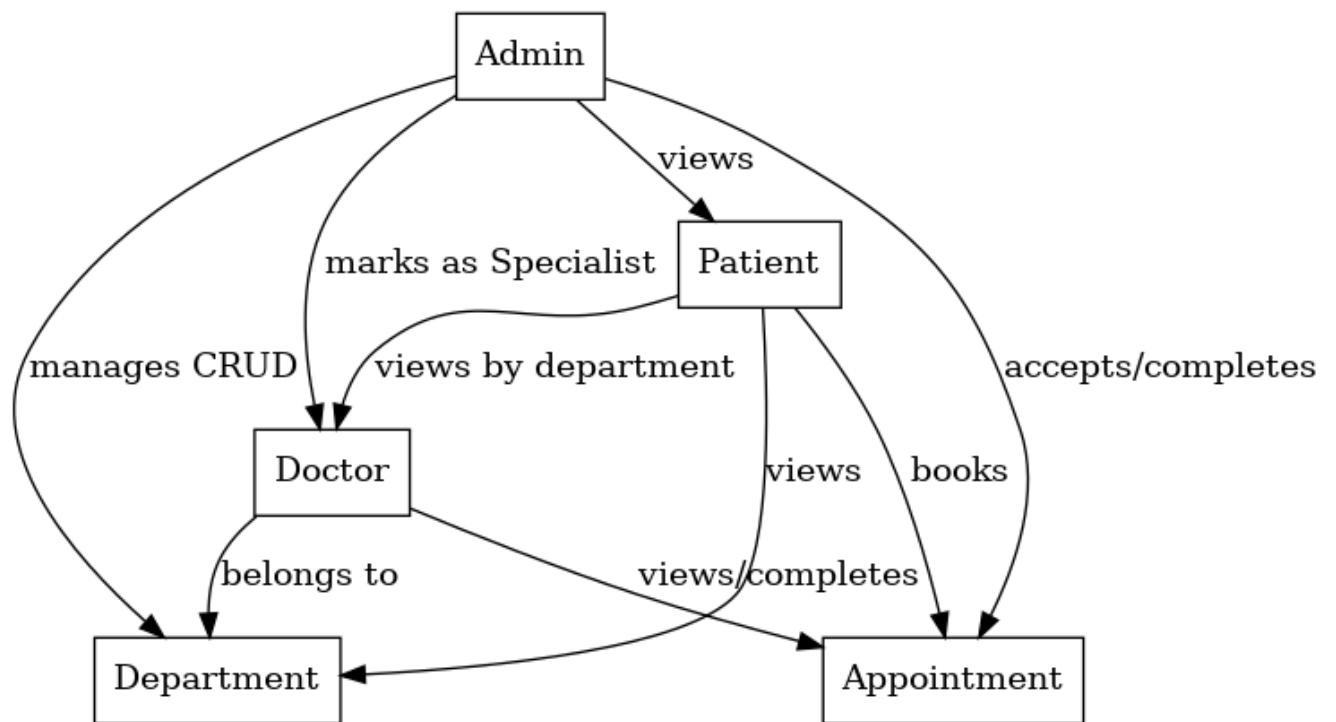

# CHAPTER FIVE

## SYSTEM DESIGN

### Use Case Diagram

## ER Diagram

# CHAPTER SIX

## **SYSTEM ANALYSIS**

### Proposed System

The Primary components of this system are as follows:

1. **User Interface (UI)** – A user-friendly platform (web and mobile) for patients, doctors, and administrators to interact with the system, book appointments, and manage profiles.
2. **Appointment Scheduling System** – A dynamic module that allows patients to book, reschedule, or cancel appointments while ensuring doctors' availability is updated in real time.
3. **Doctor Specialization & Matching Algorithm** – A system that categorizes doctors based on their expertise and matches patients with the most relevant specialists based on symptoms or medical history.
4. **Electronic Medical Records (EMR) Integration** – A secure database for storing patient records, prescriptions, and medical history, ensuring seamless access for authorized personnel.
5. **Telemedicine & Video Consultation Module** – A feature that enables remote consultations via secure video calls, messaging, or AI-driven chatbot assistance.
6. **Secure Payment Gateway** – A system for processing online payments for consultations, treatments, and medical services while ensuring compliance with financial regulations.
7. **Notification & Reminder System** – Automated email, SMS, or in-app notifications to remind patients and doctors about upcoming appointments or necessary follow-ups.
8. **Data Security & Compliance** – Strong encryption, authentication, and compliance with health regulations (HIPAA, GDPR) to protect sensitive patient information.
9. **Analytics & Reporting Dashboard** – A tool for tracking appointments, doctor performance, patient feedback, and system efficiency to improve service quality.

**10.Admin & Support Panel** – A backend system for administrators to manage users, resolve queries, and monitor platform performance for smooth operation.

### Web Application

The main purpose of this Medi-Track web application is to digitize and optimize health services by providing a seamless physician date reservation system with specialized coordination and remote committee support. The aim is to improve accessibility, efficiency and security in terms of interactions in health care for both patients and health profession.

---

## CHAPTER SEVEN

### **IMPLEMENTATION**

#### Primary Implementation Admin:

The administrator is responsible for handling the system. This involves setting up and dealing with the user accounts, operating the database and maintaining how efficiently the system performs.

#### Doctor:

The doctor will responsible for the appointment completion. He is also responsible for the updation of profile.

#### User:

The user can responsible for booking appointment and view doctors by its department.

---

## Exploring Database

Implementation of the MySQL-based and Stock Management System for a small retail has the following steps:

- **Database Design:** For storing data regarding patient and doctor. It is necessary to develop well organized database. The database must contain fields for patient, doctor and admin and the fields need to be interconnected in a proper way.
  - **User Interface Design:** The entire system should have a user -friendly dashboard which allows patients to book and display both appointment and doctors data. The interface should be customizable and function properly on a number of platforms like laptops and mobile phones.
  - **Testing and Deployment:** The system needs to be tested properly in order to ensure that it functions as planned also ensuring that the data precise and secured. When the testing is completed the system can be uploaded on the hosting site and made accessible to all the clients.
  - **Maintenance and Upgrades:** Regular maintenance and upgrades must be performed on the system to ensure that it continues to function effectively and provide the necessary level of service. This may involve fixing bugs, adding new features, and upgrading the underlying software and hardware components.
-

```

The screenshot displays the 'Doctor Profile & Settings' page. On the left, a sidebar contains navigation options: Dashboard, Appointments, Patients, Profile (highlighted), and Logout. The main area shows the profile for 'Dr. mks' with email 'mks@gmail.com'. It features a circular profile picture placeholder with a camera icon. Below this, there are fields for 'Specialization', 'License Number' (234500321), 'Hourly Rate (\$)' (1200.0), 'Age' (29), 'Experience (Years)' (3), and 'Address' (bbsr,odisha). A blue 'Save Changes' button is positioned at the bottom center of the form.

# CHAPTER NINE

## TESTING

### Introduction

Software testing is a critical stage in the development of the Medi-Track project to ensure reliability, security and optimal performance. Given the fact that the application handles sensitive patient data and real-time doctor dates, rigorous functional tests are performed to see if key features such as date booking, specialisation, telehealth services work seamlessly. Security testing is essential to protect your electronic medical records (EMR) and to comply with regulations such as HIPAA and GDPR. Performance testing allows the system to master high traffic loads without downtime, and usability testing ensures smooth experiences for patients and health service providers. Integration testing is performed to verify the seamless interaction between APIs from third-party providers, payment gateways and EMR systems. Additionally, automated tests of regression tests are performed to catch problems early on, reducing the risk of system errors. By following a structured testing approach, Medi-Track systems ensure the accuracy, security and efficiency of digital health services.

### **Unit Testing**

Unit testing is an essential issue of software testing for Medi-Track initiatives, making sure that character additives and functions work as anticipated. This manner assessments small, unbiased gadgets of the software. B. schedule, scientific Specialization, Certification, and price Processing Modules. each unit is tested on its own the usage of automatic unit tests frequently written in test frameworks such as Jest (for JavaScript), Pytest (for Python), and JUnit (for Java). Fine statistics and dependency injection is used to simulate real situations without affecting the entire gadget. by identifying and putting off mistakes early on, testing unit exams improves code excellent, reliability, and protection, and reduces the danger of disasters in later improvement levels. additionally, difficult techniques for unit testing make sure smoother integration and scalability. In other words, MEDl generation systems for clinical operations are sturdy and green.

# CHAPTER TEN

## CONCLUSION

The Medi-Track assignment is a transformative strategy to modernize healthcare via improving health practitioner appointments, professional coordination and telehealth offerings. via the combination of superior technology together with comfortable digital clinical statistics (EMR), automated planning, and actual time notification, the gadget improves accessibility, efficiency and affected person care. strong security measures ensure compliance with healthcare policies which include HIPAA and GDPR, and defend sensitive scientific information. The machine guarantees reliability and seamless capability via rigorous software testing, including unit testing, integration testing, and performance evaluation. in the long run, the Medi-Track project closes the gap between patient and fitness carrier companies, reduces latency, optimizes resource allocation, and improves the overall healthcare revel in. Its scalable and user-pleasant approach gives precious capital in an growing digital fitness surroundings.

## Project Limitation

1. Requires a stable internet connection for appointment booking, telemedicine consultations, and accessing medical records.
2. Despite security measures, there is always a risk of cyberattacks, data breaches, or unauthorized access to sensitive patient information.
3. Some doctors and patients, especially in rural or less tech-savvy regions, may find it difficult to transition from traditional healthcare systems to digital platforms.
4. Server crashes, software bugs, or maintenance periods may disrupt appointment scheduling and telemedicine services.
5. Telemedicine consultations cannot fully replace in-person visits for cases requiring physical diagnosis, lab tests, or emergency care.

# CHAPTER ELEVEN

## FUTURE ENHANCEMENTS

The Medi-Track project has several future enhancements that can improve healthcare accessibility, efficiency, and security:

- **AI-Powered Diagnosis & Predictive Analytics:** Implement AI to analyze patient data, predict potential health risks, and assist doctors in early diagnosis.
- **IoT-Based Health Monitoring:** Integrate wearable devices to track real-time vitals and provide instant alerts for critical health conditions.
- **Blockchain for Secure Medical Records:** Use blockchain technology to ensure tamper-proof, decentralized, and secure patient data management.
- **VR-Based Telemedicine:** Enhance remote consultations with virtual reality for a more immersive doctor-patient interaction.
- **Multilingual AI Chatbots:** Develop AI-driven chatbots capable of handling patient queries and appointment bookings in multiple languages.
- **Automated Insurance & Billing:** Integrate automated claim processing and digital payments to streamline medical transactions.
- **Big Data for Personalized Treatment:** Utilize big data analytics to create personalized healthcare plans based on patient history and lifestyle.
